

Raccoon App - Clarified Development Plan

Phased Development Scope - Clarified Implementation Requirements

IMPORTANT - Scope & Pricing Clarification

The details added to Phase 2 and Phase 3 below are clarifications of the already agreed work, intended to remove ambiguity and make implementation expectations explicit. They are not intended to create a new paid phase or increase the agreed prices of Phase 2 or Phase 3. Phase 1 remains unchanged. Phase 4 (Workout Game) is a new feature and is intentionally priced as Unknown / To Be Quoted by Developer.

Phase	Price	Status
Phase 1	\$100	Completed / Unchanged
Phase 2	\$400	Agreed price - clarified scope
Phase 3	\$350	Agreed price - clarified scope
Phase 4 - Workout Game	Unknown	New feature - developer to quote

Phase 1 - \$100

Authentication, Account Security & Testing

Phase 1 is already completed and remains exactly as originally agreed. No changes are requested in this document.

- Fix the existing Google Login and remove the broken or duplicate authentication route.
- Ensure Google authentication logs users in correctly and creates the expected session.
- Strengthen authentication and session configuration and use a secure session/token secret.
- Implement proper server-side verification for admin sessions and protect restricted/admin routes.
- Ensure logout correctly ends the user session.
- Implement Forgot Password, secure password-reset tokens, password-reset email, reset-password page, and new-password flow.
- Validate and expire or invalidate password-reset tokens after use and handle invalid or expired links.
- Send email-verification emails after signup and implement verification token generation, validation, and status update.
- Handle invalid or expired email-verification links.
- Test email/password signup and login, Google Login, Forgot Password, Password Reset, Email Verification, Logout, protected/admin routes, and invalid or expired token cases.

Required Access / Information

- Resend account, API key, and verified sending domain for Welcome, Email Verification, and Password Reset emails.
- Existing Google OAuth credentials, or access to Google Cloud Console if the current credentials need to be updated.

Phase 2 - \$400

Clarification: The items below explain the already agreed Phase 2 production scope in more detail. The price remains \$400.

1. Stripe Production Payments & Premium Packages

- Payments are purchased inside the Raccoon website, with Stripe used as the payment processor.
- Premium packages must be exactly: 1 Week - \$3.99; 1 Month - \$9.99; 3 Months - \$24.99. Remove the Lifetime package/option.
- Each package is a one-time payment by default.
- Each package card must include an Automatic Renewal toggle. Recurring billing is enabled only when the user intentionally turns this on.
- Successful payment: activate Premium immediately and return the user to the Raccoon home page.
- Failed payment: show a clear failure state and do not grant Premium.
- Users must be able to cancel Automatic Renewal from the existing subscription area in Profile using a clear Cancel Subscription action.
- Cancellation stops future renewal only; Premium remains active until the end of the already-paid period.
- If an automatic renewal payment fails, Premium ends when the current paid period expires and the account returns to free status.
- Use all practical payment methods supported by the configured Stripe account and environment, including Apple Pay / Google Pay where available.
- Review every Premium pricing card, label and description and make sure package durations, prices and Premium benefits are accurate and consistent across checkout, Profile and any Premium page.
- Cross-phase consistency: after all phases are implemented, the Premium benefits copy must match the actual access rules in the product. Do not advertise a feature as Premium unless the implemented access rules actually make it Premium. If Phase 4 changes any entitlement, update the Premium copy accordingly.

2. Performance & Application Optimization

- Optimize the full application for fast loading, fast navigation, smooth interaction and minimal freezing or lag.
- Video chat, games and general UI should remain smooth and responsive on desktop and mobile.
- Reduce unnecessary resource usage and remove obvious performance bottlenecks.
- The application should be prepared to maintain good performance as user volume grows.

3. Video Chat Improvements

- Improve call stability, faster matching, latency, TURN/STUN behavior, video quality and microphone reliability.
- Use the front camera for matching. Rear-camera switching is not required.
- Show a clear Connecting state while a match is being established.
- Do not keep users in a Reconnecting state with the same disconnected match. If a match disconnects or becomes unusable, cleanly end that session and move the user to the next match/search flow as quickly as possible.
- Long-distance connections should remain as stable and low-latency as reasonably possible.

4. Continent Filter

- Replace the existing country-filter behavior with a Continent filter where applicable.
- Premium users may select: Europe, Asia, Middle East, North America, South America, Africa and Oceania.
- Free users are locked to All / Worldwide.
- Filtering must be accurate and fast and must not cause matching to hang.
- If no user is available in the selected continent, show a brief search/connection failure state, automatically fall back to All / Worldwide, and continue matching.

5. Gender Filter

- Keep the options All, Male and Female.
- Male and Female filtering are Premium-only. Free users are locked to All.
- The selected filter must be accurate, fast and must not cause matching to hang.

6. Mobile Optimization

- Optimize the full site for iPhone and Android with responsive layouts, correctly sized controls and reliable touch interaction.
- All games must remain fully playable on small screens with no clipped controls, broken overlays or unusable layouts.
- Opening the mobile keyboard must not break the layout, push critical content off-screen or cover essential controls.
- Normal chat and game chat must continue to work correctly while the keyboard is open.
- General Raccoon mobile usage should remain Portrait-only, except Drawing & Guessing and the Phase 4 Workout Game, which should use Landscape-only on mobile for the game experience.

7. Admin Dashboard Improvements

- Dashboard data must be real, current and reliable rather than stale, frozen or inaccurate.
- Show current users, users today, users this week, users this month, Premium users, revenue/payments, reports and bans.
- Allow admin to search for a user and view key matching/account data including country, gender, age and last login.
- Allow immediate Ban / Unban actions.
- The dashboard and all admin routes must remain strongly protected so only authorized admin access is possible.

8. AI Moderation

- Moderation should cover live video and text chat.
- Detect clearly abusive/profane language, sexual content and violent content.
- When a moderation violation is detected: issue a Warning, apply a 10-minute suspension, and notify the admin.

9. Report / Ban System Upgrades

- Every submitted report must appear in the Admin Dashboard immediately or as close to real time as reasonably possible.
- If admin presses Ban, the ban must apply immediately.

- Automatic anti-abuse rule: 10 reports received within 2 hours triggers a Warning + 30-minute suspension + admin notification.

10. Push Notifications

- Use standard, useful account notifications only; avoid unnecessary or spammy notifications.
- Examples: account creation success, Premium purchase/start, Premium expiry reminder, Premium expiry, automatic renewal success/failure, warning, suspension and ban.
- Other notifications should be limited to similarly important account or service events.

11. Full Security Hardening

- Harden the full application beyond Phase 1 authentication/session work, including admin access, APIs, payments, database access and user data.
- Close obvious vulnerabilities and reduce practical exploitation risk as much as reasonably possible.

12. Full Cross-Browser & Device QA

- The developer must personally test every major feature/function at least once on the main supported browsers and representative desktop/mobile devices.
- Testing must include the real flows, not only visual checks: authentication, payments, matching, filters, chat, games, admin, reports, notifications and responsive behavior.

13. Subscription Emails

- After a successful Premium purchase, send a polished confirmation email confirming the Premium purchase/period and thanking the user.

Required Access / Information

- Stripe account and required test/production credentials and webhook configuration access.
- Resend account/API access and verified sending domain for production email features.
- SMS provider access, such as Twilio or Firebase Phone Auth, for the Phone Number / OTP login flow described in Phase 3.

Phase 3 - \$350

Clarification: The items below explain the already agreed Phase 3 fixes and improvements in implementation-ready detail. The price remains \$350.

1. Website Wording & Legal Pages

- Present Raccoon clearly as a respectable social random video chat, games and entertainment platform - not as a dating website.
- Website copy should be attractive, polished, clear and consistent with the product.
- Review Terms & Conditions and existing legal pages for accessibility, desktop/mobile display, correct links, formatting, readability, broken links and acceptance flows.
- The policies should be practical for a social entertainment platform and should not unnecessarily prohibit normal joking or social interaction that is otherwise allowed.
- Recording/filming language should be written in a legally appropriate way and must not falsely claim that recording is automatically lawful in every jurisdiction.

- Check that any Raccoon contact email addresses shown in legal/policy pages are the correct owner-approved addresses.
- **IMPORTANT:** Do not redesign or visually restyle the existing Policy / Legal pages. Only update the requested text, information, links and functional issues.

2. Admin Authentication & Security

- Strengthen admin authentication with server-side permission verification, authorized-account checks, protected admin routes, secure session handling and reliable logout.
- Add a phone-number verification layer for authorized admin access.
- The developer must ask the owner for the exact authorized phone number / verification details before implementation; do not guess or hard-code an unapproved number.

3. Profile Editing & New-User Onboarding

- Every first-time/new user must complete onboarding regardless of sign-in method: Google, Email/Password, Guest, and Phone Number / OTP.
- Required onboarding fields: Gender and Date of Birth.
- Country should be detected automatically where reasonably possible, and the user should be clearly shown which country was detected.
- Display Name and Profile Picture are optional and must be labelled Optional.
- If the user skips optional name/photo, assign a random/default display name and random/default profile picture.
- Existing users can later edit Display Name and Profile Picture from the Profile page, and changes must appear everywhere profile information is shown.
- Completed users must not be forced through onboarding on every login.
- Remove Gender Preference and Country Preference from every signup/login flow. Matching preferences belong only in the Matching Page filters.
- Add Phone Number / OTP as an additional account creation and login method.

4. Profile Data & Matching Display

- Store Gender, Date of Birth/Age and Country correctly and make the matching system use the stored values accurately.
- While connecting to a matched user, before the full video match opens, show that user's Profile Picture, Display Name, Age, Gender and Country.
- After the video match starts, keep the same information visible in a small clean corner overlay that does not block the video.

5. Waiting for Match Character

- Make the Raccoon character on the Waiting for Match screen significantly larger while keeping it responsive.
- Do not place the character inside a circle/frame; it should appear like a sticker with a transparent background.
- Before replacing the image, the developer must ask the owner for the exact Raccoon image to use.

6. Match Text Chat

- Fix Match Text Chat on desktop and mobile so messages display naturally from left to right / horizontally with correct wrapping.

- Fix the current issue where text becomes extremely narrow or appears vertically letter-by-letter.
- Keep chat sizing and layout responsive across devices.

7. UNO & General Game Experience

- Fix UNO turn indicator/arrows so the active turn is accurate, immediate and visible on every screen size.
- When it is the local user's turn, the arrow should point to the local user's camera; when it is the opponent's turn, it should point to the opponent's camera.
- Keep both players' cameras as large as reasonably possible without covering or breaking the game. Camera size/placement should adapt to the game and to desktop/mobile.
- Fix overlapping game buttons and controls. Remove the extra/duplicate buttons currently appearing above the bottom Skip / Report area and keep only the controls actually required.
- Respect mobile safe areas.
- Synchronize UNO actions so both players clearly see important state changes, including card draw actions and color changes.
- For every game, show the winner/result screen for 10 seconds. Show the winner's name clearly and place a crown on the winner's profile picture with a celebratory design. If a game supports a draw, show Draw appropriately.
- When any game starts, hide nonessential matching UI and controls. During the game, keep only End Game and Skip visible unless the game itself requires a specific control.
- End Game ends only the game and returns both users to the same normal video match.
- Skip ends the current match and starts the next matching/search flow.
- Game buttons start the selected game immediately for both players; there is no Accept / Decline challenge request.

8. Drawing & Guessing

- Optimize Drawing & Guessing for mobile touchscreens, canvas sizing, controls, camera/game layout and guessing/chat usability.
- On mobile, Drawing & Guessing is Landscape-only and should not be playable in Portrait mode.
- Correct guesses must be detected immediately and should end/win the round immediately with clear success feedback.
- Allow a reasonable typo tolerance so one minor obvious spelling mistake can still count as the intended correct answer.
- Polish guessing chat on desktop and mobile and apply the same high-quality message display behavior to normal site chat and other game chats.
- Add at least 100 additional simple, drawable words/prompts without obvious duplicates.
- Randomize content and avoid repeating the same word to the same players during the same play session while unused words remain.

9. Raccoon Feud Content

- Add at least 50 additional Raccoon Feud questions that fit the existing game structure.
- Questions should be varied, fun and free of obvious duplicates.
- Randomize question selection and avoid repeatedly giving the same question to the same players during the same play session while unused questions remain.

10. Game QA

- The developer must personally test every game from start to finish on desktop and mobile, not only inspect the visuals.
- Verify rules, turns, buttons, cameras, chat, scoring, correct/wrong answers, winner/result behavior and game exit/return behavior.

11. Matching, Skip & Disconnect Cleanup

- Skip during random matching should feel almost immediate for both users. The current match must end for both sides without hanging.
- Correctly clean up the old match/session before starting the next one.
- Detect browser close, connection loss, navigation away, phone lock/close and similar disconnects as quickly and reliably as technically possible.
- When one user disconnects, the other user should not remain stuck waiting; the ended presence/session should be reflected immediately or as close to real time as reasonably possible.

12. Private Rooms

- Use the available screen area to make Private Room video screens as large as reasonably possible for the device.
- Private Room video should generally be larger than standard random-matching video because the room has fewer matching controls.
- If a user leaves, disconnects, closes the page, loses connection or otherwise leaves the room, remove that user's active presence immediately or as close to real time as reasonably possible and show the remaining user that the person left.
- Do not leave stale room/session presence. A user who left days ago must not still appear as active in the room when returning later.
- Add self Mute / Unmute and self Camera On / Off controls. These controls affect only the local user's own stream and never control the other user's microphone/camera.

13. Google / Search Branding & Discoverability

- Fix the incorrect/poor icon currently appearing for Raccoon in Google/search results.
- Before changing the search/site image, the developer must ask the owner for the exact approved image/icon to use.
- Correctly configure favicon/site icons, website title, meta description, Open Graph image, structured/site metadata and remove/update old/default assets causing incorrect branding.
- Write clear, attractive search-result title/description copy that presents Raccoon as a social random video chat + games + entertainment platform.
- Prepare the site correctly for indexing/search discovery so it can appear through relevant Google searches, not only through direct-link access.
- Configure technical SEO/indexing fundamentals correctly (including crawlable pages and relevant metadata). Search-engine crawl timing and ranking remain controlled by Google and are not guaranteed by the developer.

Phase 4 - Workout Game

Price: Unknown / To Be Quoted by Developer

This is a new feature and is separate from the fixed prices of Phase 2 and Phase 3.

1. Entry Button & Exercise Selection

- Add a Workout Game button beside the existing game buttons using this exact main button icon: 🏋️
- Pressing the 🏋️ button opens three exercise choices: Push-ups, Squats and Plank.
- Each exercise choice should use a clear image/icon showing that exercise, with a short simple description directly underneath.
- The developer must ask the owner for the exact Push-up, Squat and Plank button images/icons before implementation. Do not choose final images without owner approval.
- Selecting an exercise starts that exercise immediately for both matched users. There is no Accept / Decline request.

2. Mobile Orientation & Layout

- Workout Game should be Landscape-only on mobile.
- Use very large camera views and the maximum practical screen area for both players.
- During the workout challenge, hide all nonessential matching/game UI. Keep only End Game and Skip visible, plus the workout-specific counters/timers/status information.
- The repetition counter / timer must be large and easy to read.
- Keep both players' microphones active during the challenge so they can continue hearing/talking to each other.

3. Camera Readiness & Body Tracking

- Before the countdown starts, verify that both players are positioned so the required body joints are visible and trackable for the selected exercise.
- If a player's position/camera is not suitable, show: "Adjust Your Position".
- Do not start the synchronized countdown until both players are trackable and ready.
- Once both are ready, start the same 10-second countdown for both users at the same time.
- Use clear sound effects for the countdown and distinct sounds for challenge start and challenge end.
- During the exercise, show white body-tracking points/lines over each player's video, following key joints such as shoulders, elbows, wrists, hips, knees and ankles as applicable.
- If tracking confidence is lost during the challenge, show "Adjust Your Position" and stop awarding repetitions until tracking becomes reliable again. The challenge timer continues running.

4. Push-up Challenge

- Duration: 45 seconds after the 10-second preparation countdown.
- Count only completed valid repetitions.
- A valid repetition should require a controlled down-and-up cycle with the torso kept reasonably rigid, no obvious hip sag/hike, a sufficiently lowered bottom position, and a return to the top with elbows extended.
- Use reasonable pose-estimation tolerance rather than requiring mathematically perfect angles, but do not count obvious half-reps or simple arm/body movement that is not a full push-up.
- The player with the highest number of valid repetitions after 45 seconds wins.
- If both players have the same valid count, the result is Draw with no extra time.

5. Squat Challenge

- Duration: 45 seconds after the 10-second preparation countdown.

- Count only completed valid repetitions.
- A valid repetition should require a full standing-to-squat-to-standing cycle: the player descends with controlled hip/knee flexion to a clear squat depth, keeps the torso/back reasonably controlled, then returns to a clear standing position.
- Use reasonable pose-estimation tolerance, but do not count shallow partial dips or incomplete repetitions.
- The player with the highest number of valid repetitions after 45 seconds wins.
- If both players have the same valid count, the result is Draw with no extra time.

6. Plank Challenge

- No fixed maximum challenge time.
- After the synchronized 10-second preparation countdown, start a visible hold timer for each player.
- A valid plank requires a stable supported position with shoulders/upper body aligned over the support, legs extended, and torso/hips kept reasonably straight without obvious hip sag, hip hike or knee collapse.
- Continue timing while the player maintains a valid plank.
- The first player who clearly breaks the plank position loses; the other player wins.
- Show each player's hold time in the result.

7. Workout Result Screen

- After Push-ups or Squats, show a polished, exciting result screen for 10 seconds.
- Show both players' valid repetition counts, the winner's name and profile picture, a crown on the winner, and the score difference (for example, +6).
- For a tied Push-up/Squat result, show Draw with no winner/crown.
- After Plank, show the winner plus both hold times in a similarly polished result design.
- After the 10-second result screen, automatically end the game and return both users to the same normal video match. Do not automatically start another workout or search for a new user.

8. End Game, Skip & Disconnect Behavior

- End Game ends only the Workout Game and returns both users to the same normal video match.
- Skip ends the current video match and returns the user to the matching/search flow.
- If either user leaves, skips, closes the page, loses connection or disconnects during the Workout Game, do not award an automatic win. End the workout and return the remaining user to the matching/search page.

9. Cross-Phase Integration

- Integrate Workout Game with the same matching/session cleanup rules, responsive game behavior, winner/result conventions and QA expectations described in Phase 2 and Phase 3.
- Apply the existing product access/entitlement rules consistently. If Workout Game is configured as a Premium benefit, update the Premium feature list and UI everywhere it is shown; if it is not Premium, do not advertise it as a Premium benefit.
- Test the Workout Game end-to-end on representative desktop and mobile devices, including body readiness, tracking, countdown synchronization, counters, timers, sound effects, End Game, Skip, disconnects, result screens and return-to-match behavior.

Owner-Provided Assets / Information

- Approved Raccoon image for Waiting for Match.
- Approved Google/search/site icon image.
- Approved Push-up, Squat and Plank button images/icons.
- Authorized admin phone number / verification details.
- Correct Raccoon contact email addresses for legal/policy pages.
- Stripe, Resend, Google OAuth and SMS/OTP provider access as required.

Final Implementation Principle

The developer should treat this document as one connected product specification rather than isolated bullets. Payments and Premium copy must match real entitlements; onboarding data must feed matching; matching/disconnect cleanup must also work inside games and Private Rooms; mobile rules must be applied to every relevant screen; game UI/result behavior must stay consistent; and all owner-supplied images/contact details must be requested before final implementation where specified.
